

## How to manage geometric relationships between components

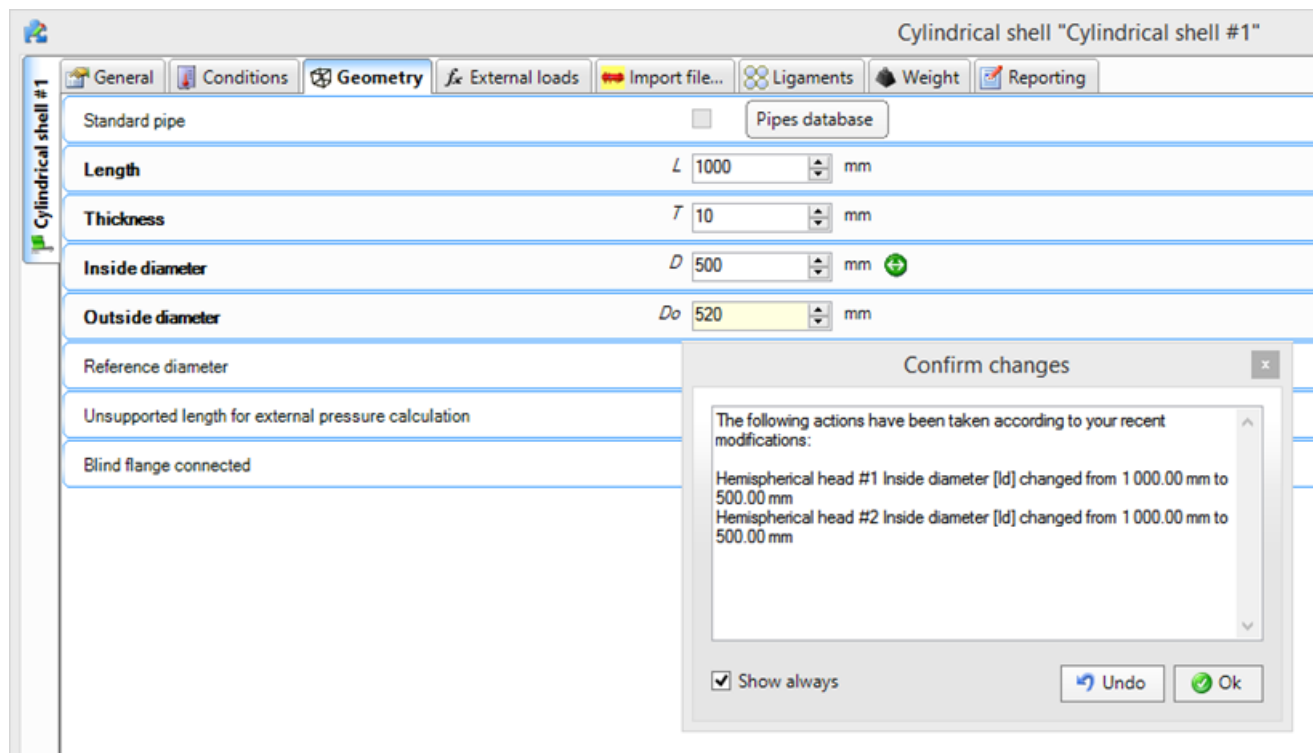

NextGen takes care of keeping the geometry of the designed components consistent. In some contexts, it is necessary to disable this behavior and separate the dimensions between the various components.

## How to manage geometric relationships between components

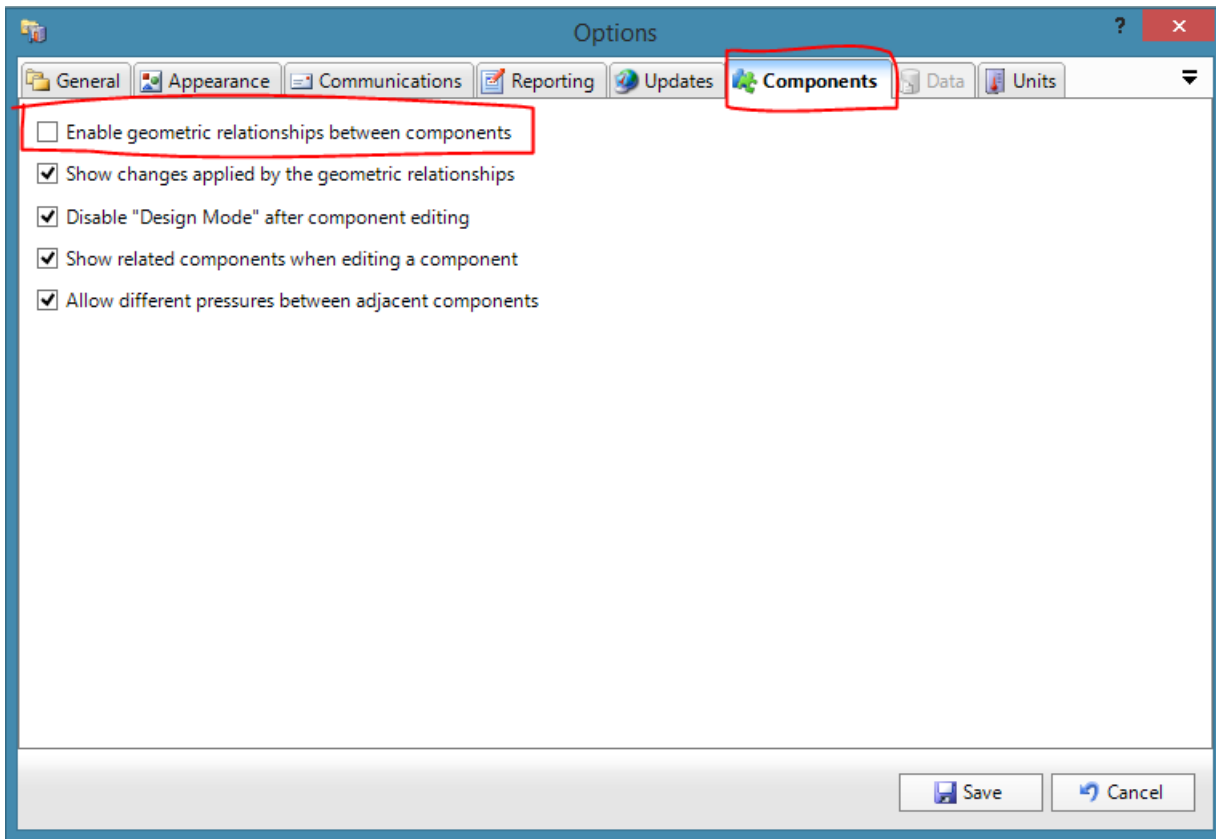

By default, NextGen takes care of maintaining geometric relationships between components of an item. For example, when a vessel made of a cylinder and two heads having inside diameter 1000 mm is made and later cylinder inside diameter is lowered to 500 mm, NextGen resizes adjacent heads to keep vessel's shape congruent. The software shows a message like the following to notify the user:

There are cases when this behavior is not necessary or wanted; here's a couple of options to disable it.

### Completely disable geometric relationships

Relationships can be disabled completely by selecting Tools > Options and then unchecking "Enable geometric relationships between components" under "Components" tab. This way, the user has complete control over items geometry, including type and number of bolts and gaskets in flange joints.

## Partially disable relationships

In cases when only one or few relationships must be disabled, a "Relationships" tab can be found in the component editing window (this tab is visible only when the checkbox "Enable geometric relationships between components" is enabled): from this tab an accurate control over single relationships is possible, enabling or disabling them at wish.

A relationship is defined when a component is connected to another. For example, in a cylinder-flange-blind flange vessel, cylinder will not list any relationship, flange will list relationships with cylinder (go, inside diameter), blind will list relationships with flange (bolts, gasket). These are bi-directional relationships, so if cylinder thickness is modified, go of flange will be modified too. Therefore, it is better to look at both components when a relationship must be disabled.

Welding neck flange "Welding neck flange #1"

General Conditions Geometry External loads Bolts Gasket Standard

**Welding neck flange #1**

Name / Position: Welding neck flange #1

Flange material: SA-516 70 Database

Undertolerance: 0 mm

Overpressure due to static head - internal: 0 MPa

Overpressure due to static head - Hydraulic test: 0,01 MPa

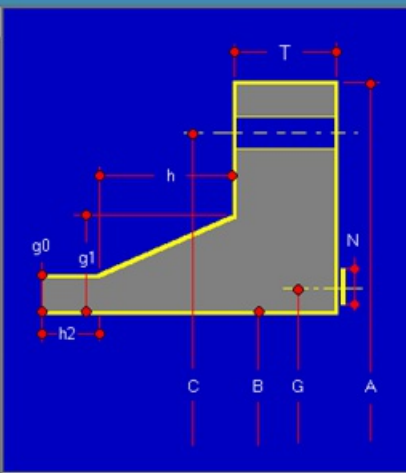

Overpressure due to static head - external: 0 MPa

Calculate bolt torque according to ASME PCC-1:

Design mode:

Perform rigidity check according to Appendix 2.14:

Substitute B1 for B in the formula for longitudinal stress:

Validation Information

MAP N&C (R) 1.36 MPa  
MAWP H&C 2.21 MPa  
MAWP H&C 1.36 MPa

MDMT -29.00 °C
